

# OverSight

for AWS QuickSight

## Agile Dashboard Management

### Dashboard Development Lifecycle

OverSight (OvS) is a management tool to support AWS QuickSight Development Teams. It supports the creation of a structured and repeatable dashboard development lifecycle (DDLCL).

Using OverSight, QuickSight Development Teams define Applications comprised of groups of QuickSight objects and then create release versions representing snapshots of their Applications, throughout their development projects. Teams can choose to deploy Releases of their Applications to one or more QuickSight environments at any time, immediately or in the future. This lifecycle allows teams to define groups of AWS QuickSight objects as applications. Development Teams can then create a Release from an Application and deploy any Release to one or multiple QuickSight environments.

Applications enable your teams to manage a QuickSight based solution as a single, cohesive unit making it easier to share their work with others and migrate between development, test, and production environments.

### Efficient QuickSight Development Teams

Spend more of your team's valuable time crafting better dashboards to exceed business expectations rather than working through tedious steps to migrate between environments. OverSight's web-based GUI lets you select and deploy changes to your QuickSight objects in minutes, not days.

### OverSight Features

- 01 Quickly move your QuickSight objects between environments such as Development, Test and Production.
- 02 Manage your QuickSight solutions as a complete application to version, promote and rollback your work.
- 03 Copy and move QuickSight objects across your QuickSight accounts, without the use of complicated APIs and JSON structures.
